Section 1 : Coding

1. Problem Statement

You are given a series of magic levels (integers) and need to construct a Binary Search Tree (BST) from them. After constructing the BST, your task is to perform a range search, which involves finding and printing all the magic levels within a specified range [L, R].

Input Format

The first line of input consists of an integer N, the number of magic levels to insert into the BST.

The second line consists of N space-separated integers, representing the magic levels to insert.

The third line consists of two integers, L and R, which define the range for the search.

Output Format

The output prints all the magic levels within the range [L, R] in ascending order, separated by spaces.

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 5
10 5 15 3 7
2 20
Output: 3 5 7 10 15

Answer

```
#include <stdio.h>
#include <stdlib.h>
struct Node {
    int data;
    struct Node* left;
    struct Node* right;
};
struct Node* createNode(int value) {
    struct Node* newNode = (struct Node*)malloc(sizeof(struct Node));
    newNode->data = value;
    newNode->left = newNode->right = NULL;
    return newNode;
}

struct Node* insert(struct Node* root, int value) {
    if (root == NULL) {
        return createNode(value);
    }
    if (value < root->data) {
        root->left = insert(root->left, value);
    } else {
        root->right = insert(root->right, value);
    }
    return root;
}
```

```
void rangeSearch(struct Node* root, int L, int R) {
    if (root == NULL) {
        return;
    }

    if (root->data > L) {
        rangeSearch(root->left, L, R);
    }

    if (root->data >= L && root->data <= R) {
        printf("%d ", root->data);
    }

    if (root->data < R) {
        rangeSearch(root->right, L, R);
    }
}

int main() {
    int N, i, L, R;
    scanf("%d", &N);

    int values[N];
    for (i = 0; i < N; i++) {
        scanf("%d", &values[i]);
    }

    scanf("%d %d", &L, &R);

    struct Node* root = NULL;

    for (i = 0; i < N; i++) {
        root = insert(root, values[i]);
    }

    rangeSearch(root, L, R);

    return 0;
}
```

Status : Correct *Marks : 10/10*

2. Problem Statement

John is building a system to store and manage integers using a binary search tree (BST). He needs to add a feature that allows users to search for a specific integer key in the BST using recursion.

Implement functions to create the BST and perform a recursive search for an integer.

Input Format

The first line of input consists of an integer representing, the number of nodes.

The second line consists of integers representing, the values of nodes, separated by space.

The third line consists of an integer representing, the key to be searched.

Output Format

The output prints whether the given key is present in the binary search tree or not.

Refer to the sample output for the exact format.

Sample Test Case

Input: 7
10 5 15 3 7 12 20
12
Output: The key 12 is found in the binary search tree

Answer

```
#include <stdio.h>
#include <stdlib.h>
struct Node {
    int data;
```

```
    struct Node* left;
    struct Node* right;
};
struct Node* createNode(int value) {
    struct Node* newNode = (struct Node*)malloc(sizeof(struct Node));
    newNode->data = value;
    newNode->left = newNode->right = NULL;
    return newNode;
}
struct Node* insert(struct Node* root, int value) {
    if (root == NULL) {
        return createNode(value);
    }
    if (value < root->data) {
        root->left = insert(root->left, value);
    } else {
        root->right = insert(root->right, value);
    }
    return root;
}
int search(struct Node* root, int key) {
    if (root == NULL) {
        return 0;
    }
    if (root->data == key) {
        return 1;
    }
    if (key < root->data) {
        return search(root->left, key);
    } else {
        return search(root->right, key);
    }
}

int main() {
    int n, key;
    scanf("%d", &n);

    int values[n];
    for (int i = 0; i < n; i++) {
        scanf("%d", &values[i]);
    }
```

```
    scanf("%d", &key);

    struct Node* root = NULL;

    for (int i = 0; i < n; i++) {
        root = insert(root, values[i]);
    }

    if (search(root, key)) {
        printf("The key %d is found in the binary search tree", key);
    } else {
        printf("The key %d is not found in the binary search tree", key);
    }

    return 0;
}
```

Status : Correct **Marks : 10/10**

3. Problem Statement

Dhruv is working on a project where he needs to implement a Binary Search Tree (BST) data structure and perform various operations on it.

He wants to create a program that allows him to build a BST, traverse it in different orders (inorder, preorder, postorder), and exit the program when needed.

Help Dhruv by designing a program that fulfils his requirements.

Input Format

The first input consists of the choice.

If the choice is 1, enter the number of elements N and the elements inserted into the tree, separated by a space in a new line.

If the choice is 2, print the in-order traversal.

If the choice is 3, print the pre-order traversal.

If the choice is 4, print the post-order traversal.

If the choice is 5, exit.

Output Format

The output prints the results based on the choice.

For choice 1, print "BST with N nodes is ready to use" where N is the number of nodes inserted.

For choice 2, print the in-order traversal of the BST.

For choice 3, print the pre-order traversal of the BST.

For choice 4, print the post-order traversal of the BST.

For choice 5, the program exits.

If the choice is greater than 5, print "Wrong choice".

Refer to the sample output for the formatting specifications.

Sample Test Case

Input: 1
5
12 78 96 34 55
2
3
4
5
Output: BST with 5 nodes is ready to use
BST Traversal in INORDER
12 34 55 78 96
BST Traversal in PREORDER
12 78 34 55 96
BST Traversal in POSTORDER
55 34 96 78 12

Answer

```
// You are using GCC
#include <stdio.h>
#include <stdlib.h>

struct Node {
    int data;
    struct Node* left;
    struct Node* right;
};

struct Node* createNode(int data) {
    struct Node* newNode = (struct Node*)malloc(sizeof(struct Node));
    newNode->data = data;
    newNode->left = newNode->right = NULL;
    return newNode;
}

struct Node* insert(struct Node* root, int data) {
    if (root == NULL)
        return createNode(data);
    if (data < root->data)
        root->left = insert(root->left, data);
    else
        root->right = insert(root->right, data);
    return root;
}

void inorder(struct Node* root) {
    if (root == NULL)
        return;
    inorder(root->left);
    printf("%d ", root->data);
    inorder(root->right);
}

void preorder(struct Node* root) {
    if (root == NULL)
        return;
```

```
    printf("%d ", root->data);
    preorder(root->left);
    preorder(root->right);
}

void postorder(struct Node* root) {
    if (root == NULL)
        return;
    postorder(root->left);
    postorder(root->right);
    printf("%d ", root->data);
}

int main() {
    int choice, N, data;
    struct Node* root = NULL;

    while (1) {
        if (scanf("%d", &choice) == EOF)
            break;

        if (choice == 1) {
            scanf("%d", &N);
            root = NULL;
            for (int i = 0; i < N; i++) {
                scanf("%d", &data);
                root = insert(root, data);
            }
            printf("BST with %d nodes is ready to use\n", N);
        }
        else if (choice == 2) {
            printf("BST Traversal in INORDER\n");
            inorder(root);
            printf("\n");
        }
        else if (choice == 3) {
            printf("BST Traversal in PREORDER\n");
            preorder(root);
            printf("\n");
        }
        else if (choice == 4) {
```

```
            printf("BST Traversal in POSTORDER\n");
            postorder(root);
            printf("\n");
        }
        else if (choice == 5) {
            break;
        }
        else {
            printf("Wrong choice\n");
        }
    }
    return 0;
}
```
